SIL Performance Data

The Charollais Sheep NZ flock has many linkages, therefore the connectedness of this flock qualifies it to be evaluated against the rest of the Terminal industry with maximum accuracy that the performance can provide.

Production Indexes

All indexes are an estimate of the genetic merit of each ram as a sire for each trait or combination of traits compared to other rams in the flock. They are expressed in cents to show the financial benefit of this genetic merit. Genetic merit is cumulative and compounding (like compound interest at the bank).

NZTW is the sum of the economic value of each sub index, Growth, Meat Yield and Survival.

TSM is SIL Terminal sire meat yield index which represents estimated meat yield adjusted for carcase weight.

TSG is SIL Terminal sire growth index which represents estimated growth to autumn.

Breeding Values

Are an estimate of genetic merit for a single trait. They are measured in the units of the trait.

Breeding value is calculated using information from the individual animal and its relatives, the deviation from the group and the heritability of the particular trait.

WWT = weaning weight (kg), LW8 = autumn liveweight (kg), EMAC = eye muscle area adjusted for carcase weight (cm²)
